Highlights

The sieve column is held at the top by a rubber pad with spherical seat and rotates eccentrically at the bottom ensuring uniform shaking of the sample across the whole surface of the sieves.

Upon each revolution, a simple mechanical mechanism imparts hits at the base of the sieve column so as to move the sample on the sieve

surface for a very efficient sieving action. The front panel includes the mains switch, the emergency stop button and timer.

The shaker has to be fixed to the base through the four holes at the base. A noise reduction cabinet is also available for housing the shaker. (Refer accessories).
